

SINPAIN

Developing a Game-Changing Treatment for Knee Osteoarthritis

SINPAIN is developing an advanced, safe, efficient, and cost-effective nanotherapeutics pipeline to treat knee osteoarthritis.

SINPAIN's innovative therapy uses small interfering ribonucleic acid (**siRNA**) to alter the expression of disease-related targets, to restore the healthy tissue environment.

The novel, locally administered **SINPAIN** gene therapy targets disease-causing genes, enabling a more individualised and patient-centric approach.

Specifically designed machine learning tools will support the development of personalised therapies.
